# Nomenclature

\(\lambda\) integer\(\rangle\) \(\lambda\) positive integer\(\rangle\) \(\lambda\) non-negative integer\(\rangle\)

\foo	T <sub>F</sub> X control sequence.
fooenv	MTFX environment foo.
foo <sub>stv</sub>	PGFPLOTS style with key foo.
foo	Terminal symbol, literal text.
$\langle foo \rangle$	Non-terminal symbol, metasyntactic variable.
$\langle foo \rangle \rightarrow \langle bar \rangle$	Production rule; $\langle foo \rangle$ can be replaced by $\langle bar \rangle$ ,
	$\langle foo \rangle$ and $\langle bar \rangle$ are implicit groups.
⟨foo⟩ ⟨bar⟩	Sequence; $\langle foo \rangle$ followed by $\langle bar \rangle$ .
$\langle foo \rangle   \langle bar \rangle$	Choice; $\langle foo \rangle$ or $\langle bar \rangle$ .
$\langle foo \rangle^*$	⟨foo⟩ can occur zero or more times.
$\langle foo \rangle^+$	(foo) can occur one or more times.
$\langle foo \rangle^{?}$	$\langle foo \rangle$ is optional.
()	Explicit group.
$\triangleright \langle key \rangle = \langle value \rangle$	User option, (key) and (value) are implicit
. , ,	groups.
> ⟨kev⟩	User option without a value.
	Default value is 42.
<u>42</u> →	Line continuation mark.
⟨empty⟩	Nothing.
⟨newline⟩	Newline character, ^^M in T <sub>E</sub> X.
⟨dimension⟩	A legitimate T <sub>F</sub> X dimension.
⟨number⟩	$(-\infty,\infty)\cap\mathbb{R}$ .
(positive number)	$(0,\infty)\cap\mathbb{R}.$
(non-negative number)	$[0,\infty)\cap\mathbb{R}.$
/integer\	( 20 20) 0 7

 $(-\infty,\infty)\cap\mathbb{Z}$ .  $(0,\infty)\cap\mathbb{Z}$ .  $[0,\infty)\cap\mathbb{Z}$ .

## 1 General

#### 1.1 Document Structure

```
\label{eq:continuous_problem} \begin{center} & y = e^x \\ \begin{center} & 150 \\ \begin{center} & 100 \\ \begin{center} & 50 \\ \begin{center} & 50 \\ \begin{axis}[title={\$y = e^x\$}] \\ \addplot+[no markers] {\{exp(x)\}}; \\ \end{axis} \\ \end{tikzpicture} \\ \end{center} \begin{center} & 50 \\ \cline{-100} & -5 \\
```

## 1.2 PGFPLOTS Options

```
\label{eq:list_def} $$ \protect{\langle key/value\ list\rangle} $$ $$ \langle key/value\ list\rangle \rightarrow (\langle key\rangle = \langle value\rangle,)^* $$
```

Options are supplied as a \(\lambda key/value list\rangle\). The \(/pgfplots/\) and \(/tikz/\) prefixes in \(\lambda key\rangle\) can be omitted in the scope of PGFPLOTS commands. Please note that a trailing comma in \(\lambda key/value list\rangle\) does no harm.

## 1.3 Key Handlers

```
\pgfplotsset{\key\/.style = {\key\value list\}}
Define or replace style \key\.
\pgfplotsset{\key\/.append style = {\key\value list\}}
Append to style \key\.
\pgfplotsset{\key\/.code = {\TeX code\}}
Define or replace \key\/ that - when run - takes one argument; \TeX code\}
can refer to the supplied argument as #1. Invoke as \(\mathreal{\text{rey}}\) .code 2 args = {\TeX code\}}
Like \key\/.code but with two arguments; \(\text{TeX code}\)}
Like \key\/.code but with two arguments; \(\text{TeX code}\)}
simplied arguments as #1 and #2. Invoke as \(\mathreal{\text{rey}}\) (second argument\)}'.
\pgfplotsset{\key\/.cd}
Make \key\/.cd}
Make \key\/.cd}
Make \key\/.cd
```

#### 1.4 Mathematical Expressions

See the TikZ/PGF manual for a detailed description.

Use parenthesis, ( and ), for grouping. Arguments and values of trigonometric functions are in degree angle.

 $\label{eq:arithmetic operators: +, - (also unary minus), *, /, ^ (exponentiation), ! (factorial, postfix operator), r (radian, postfix operator, see deg).}$ 

Relational Operators: ==, !=, <, <=, >, >=.

Logical Operators: ! (not, prefix operator), | | (or), && (and).

Conditionals:  $\langle condition \rangle$ ? $\langle true \rangle$ : $\langle false \rangle$ .

Constants: pi, e, false, true.

Unary Functions: abs, sign, int, frac (fractional part), round, floor, ceil, factorial (see !), iseven, isodd, isprime, sqrt, exp, ln, log10, log2, sin, cos, tan, cot, sec, cosec, asin, acos, atan, deg (degree from radian), rad (radian from degree), sinh, cosh, tanh.

Binary Functions: div (integer division), mod, Mod (unsigned result), gcd, pow (see  $^{\sim}$ ), atan2, veclen (vector length in  $\mathbb{R}^2$ ).

n-ary Functions: min, max.

 $Pseudo-Random\ Number\ Functions\ (Uniform\ Distribution)\colon {\tt rnd}\ ([0,1]\cap\mathbb{R}), {\tt rand}\ ([-1,1]\cap\mathbb{R}), {\tt random}\ (n)\ ([1,n]\cap\mathbb{N}), {\tt random}\ (m,n)\ ([m,n]\cap\mathbb{Z}).$ 

#### 2 Axis Environments

```
\begin{axis} [\langle axis \ options \rangle]^?
\(\lambda axis \ options \rangle \rightarrow \lambda key/value \ list \rangle
```

 $\mathtt{axis}_{env}$ , can also be  $\mathtt{semilogxaxis}_{env}$ ,  $\mathtt{semilogyaxis}_{env}$ , or  $\mathtt{loglogaxis}_{env}$ .

▷ every \(\lambda type \rangle^?\) axis
\(\lambda type \rangle - \left(\text{linear} | \semilogx | \semilogy | \loglog)\)
Define default axis options.

▷ xmode|ymode|zmode = normal|linear|log option
 Customize axis scaling; linear is a synonym for normal.

 $ightharpoonup \log basis (x|y|z) = \langle empty \rangle | \langle positive number \rangle$  option

The basis for logarithmic axis scaling. Empty means to apply the natural logarithm (base e) to any input coordinate – if the axis scaling is logarithmic – and use the decadic/common logarithm (base 10) for displaying tick labels. Any non-empty value causes both, coordinates and tick labels, to use the logarithm with base  $\langle number \rangle$ .

## 3 Plots

\addplot[\(\rho\) pitions\)]? \(\line\) input data\\(\rho\) \(\rho\) toptions\)] utilize default options from the cycle list. \addplot[\(\rho\) pitions\)] only use the manually provided options.

ightharpoonup every axis plot (no n)? style Define  $\langle plot\ options \rangle$  for all plots or for the  $n^{\text{th}}$  plot of every axis. Plot numbers are zero-based.

## 3.1 Input Data

▷ empty line = <u>auto</u>|none|scanline|jump optio How to handle empty lines in ⟨coordinates list⟩, none means to do nothing, jump means to insert a discontinuity.

## 3.1.1 Coordinates List

```
\langle input \, data \rangle \rightarrow coordinates \, \{\langle coordinates \, list \rangle\}  \langle coordinates \, list \rangle \rightarrow \langle coordinates \rangle^*  \langle coordinates \rangle \rightarrow \langle x, y, z \rangle \, (+- \langle u, v, w \rangle)^? \, ([\langle meta \, data \rangle])^?
```

Read input data from a sequence of coordinates. x, y, and z are the point coordinates. u, v, and w are the error coordinates (reliability bounds) for error bar plots. Coordinate z and w are only mandatory for 3D plots. Empty lines in the  $\langle coordinates \ list \rangle$  indicate discontinuities; use  $\$  when gathering coordinates in a  $T_{\rm e}X$  macro.

▷ plot coordinates/math parser = true|false

optio

Whether or not to enable mathematical expressions in every coordinate inside of a  $\langle coordinates \, list \rangle.$ 

#### 3.1.2 Table Data

$$\begin{split} &\langle input \, data \rangle \to \mathtt{table} \ \, \big[ \langle table \, options \rangle \big]^? \ \, \{\langle table \, data \rangle \} \\ &\langle table \, data \rangle \to \langle file \, name \rangle \, |\, \langle inline \, table \rangle \end{split}$$

Read input data from table columns.

 $\begin{tabular}{ll} $\triangleright$ table/\langle coordinate\rangle = \langle column\,name\rangle & option \\ $\triangleright$ table/\langle coordinate\rangle & index = \langle column\,index\rangle & option \\ $\triangleright$ table/\langle coordinate\rangle & expr = \langle expression\rangle & option \\ \langle coordinate\rangle \rightarrow x\,|\,y\,|\,z\,|\,(x\,|\,y\,|\,z) & error \;(plus\,|\,minus)^{?}\,|\,meta \\ \end{tabular}$ 

Column names are case sensitive and have to exist. Use {⟨column name⟩} to quote non-trivial column names. The first column has index zero. Within ⟨expression⟩ \thisrow{⟨column name⟩} and \thisrowno⟨column index⟩ yields the cell value of the specified column. Likewise, \coordindex yields the index of the current set of coordinates and \lineno yields the total line number. Both numbers start counting at zero.

▶ table/header = true|false

Whether or not to check  $\langle table\ data \rangle$  for column names. If enabled, the first non-comment line is checked for column names. That means if any element is not a number, all entries are treated as column names.

⇒ table/skip first n =  $\underline{0}$ |⟨non-negative integer⟩ option Don't process the first n lines in ⟨table data⟩.

```
▶ table/ignore chars = {}|⟨comma-separated list⟩
                                                                                                      option

ightharpoonup table/white space chars = \{\underline{\}} \mid \langle comma\text{-}separated \ list \rangle
                                                                                                      option
\triangleright table/comment chars = \{\} \mid \langle comma\text{-}separated \ list \rangle
                                                                                                      option
```

Extra characters to be ignored, treated like a whitespace character (beside space and tab), or treated like a comment start character (beside # and %).

```
▶ table/row sep = ⟨newline⟩|\\
```

Use  $\setminus \setminus$  as the row separator if you experience problems with  $\langle newline \rangle$ , for example with inline table data or when gathering table data in a TeX macro.

```
▷ table/col sep = space|tab|comma|semicolon|colon →
        |braces|&|ampersand
```

A space column separator means one or more space or tab characters. With braces, every table cell looks like {\(contents\)} and whitespace characters between adjacent table cells is ignored. A & column separator implies 'table/trim cells = true'.

```
▶ table/read completely = auto|true|false
                                                                    option
  Whether or not to read the whole table into memory. Use with care!
```

```
▶ table/search path = {}|⟨comma-separated list⟩
                                                                        option

    ▶ table/search path/implicit . = <u>true</u>|false
                                                                         option
  Search path for input files, . means to use the standard TEX procedure.
```

```
\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\protect\pro
\addplot table [\langle table options \rangle ] {\foo};
```

Read table data once so that you can use it multiple times; \foo is a user-defined command sequence.

#### 3.1.3 Mathematical Expressions

```
\langle input \, data \rangle \rightarrow expression^? \{\langle expression \rangle\}
\langle input \, data \rangle \rightarrow (\langle x\text{-expression} \rangle, \langle y\text{-expression} \rangle, \langle z\text{-expression} \rangle)
```

Create input data by sampling a mathematical expression over an argument domain. The second form can be used to create parametric plots. Say  $\{\langle x\text{-}expression\rangle\}\$  if  $\langle x\text{-}expression\rangle$  contains parenthesis or commas. The (z-expression) is only mandatory for 3D plots.

```
\triangleright domain = -5:5 |\langle x_1 \rangle:\langle x_2 \rangle
                                                                                                                                                                      option
\triangleright domain y = \langle empty \rangle | \langle y_1 \rangle : \langle y_2 \rangle
                                                                                                                                                                       option
```

Define the argument domain for the x-axis to the closed interval  $[x_1, x_2]$ . Likewise for the y-axis for 3D plots. If domain y is empty, use the value of domain.

```
⊳ samples = 25|⟨non-negative integer⟩
                                                                     option
▷ samples y = ⟨empty⟩ | ⟨non-negative integer⟩
                                                                     option
```

The number of samples to be generated. Samples are equally spaced over the corresponding argument domain. If 'samples y' is empty, use the value of samples.

```
▷ samples at = {}|⟨comma-separated list of numbers⟩
```

Explicit argument values for sampling (expression). This option always overrides the domain and samples options.

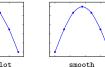

⟨comma-separated list of numbers⟩ can contain . . . expressions, for example '{-2, -1.8, ..., 2}'.

```
\triangleright variable = \underline{\mathbf{x}} \mid \langle variable \ name \rangle
                                                                                                                   option
▷ variable y = y|⟨variable name⟩
                                                                                                                   option
```

The variable name containing the argument value when evaluating ⟨expression⟩.

## 3.2 Line Plots

Connect points by straight lines. This is the default.

option

option

option

option

```
\triangleright /tikz/tension = 0.55 |\langle number \rangle
```

Connect points by a smooth curve. For best results, points should be equidistant and the bending angles should be less than about 30°. The tension option controls the sharpness of the corners; 0 yields sharp corners and 1 yields a circle if the path is a square.

 $\triangleright$  /tikz/const plot mark (<u>left</u>|mid|right)

option option

Connect points with horizontal and vertical line segments. 'const plot' is an alias for 'const plot mark left'. Markers are placed on the left corner, in the middle, or on the right corner of the horizontal line segments. Use 'const plot, no markers' to omit the markers.

▷ /tikz/jump mark (left|mid|right)

option

Like 'const plot' but omit the vertical line segments.

#### 3.3 Bar Plots

option /tikz/vbar option

Render coordinates as horizontal or vertical bars respectively.

 $\triangleright$  /pgf/bar width = 10pt|\langle dimension\rangle |\langle number\rangle

Width of a single bar. (dimension) is a TFX dimension and (number) is in axis units. Value can be a mathematical expression. The fully computed value is then available in  $\pgfplotbarwidth$ .

▷ /pgf/bar shift = Opt|⟨dimension⟩|⟨number⟩

option

Off-center distance for the bars. (dimension) is a TeX dimension and (number) is in axis units. Value can be a mathematical expression. The fully computed value is then available in  $\protect\operatorname{\mathtt{Ngfplotbarshift}}$ .

⊳ xbar = 2pt | \langle dimension \rangle | \langle number \rangle)^? > xbar(

style option

⊳ ybar bybar( = 2pt | ⟨dimension⟩ | ⟨number⟩)<sup>?</sup>

style option

Predefined axis style for bar plots; implies /tikz/xbar or /tikz/ybar respectively, bar shift autosty, and bar cycle liststy. The default handler takes one optional argument which is passed on to bar shift autosty.

▷ bar shift auto

▷ bar shift auto = 2pt|⟨dimension⟩|⟨number⟩

option

Predefined axis style setting /pgf/bar shift to the correct value based on the current plot number and the total number of plots. Argument is the distance between adjacent bars of a group.

When n bar plots are added to an axis, the total width for a group of bars is  $n \times \langle bar \ width \rangle + (n-1) \times \langle bar \ shift \ auto \rangle$ .

▷ bar cycle list

style

Predefined axis style installing a cycle list for bar plots.

 $\triangleright$  bar direction = <u>auto</u>|x|y

option

Explicitly set the bar plot direction. Not needed if you say, for example 'ybar, bar width = 1', because the direction is clear from the context.

option option

Like  $/\ensuremath{\text{tikz/ybar}}$  or  $/\ensuremath{\text{tikz/ybar}}$  respectively, but draw the bar width as an interval from this point to the next point. You need one extra point to define the interval for the last bar.

style option

▷ vbar interval

style option

∀ ybar interval( = 1|⟨relative width⟩)?

Predefined axis style for interval bar plots; implies /tikz/xbar interval or /tikz/ybar interval respectively and bar cycle  $list_{stv}$ . The default handler takes one optional argument to scale the intervals.

▷ xticklabel interval boundaries

style

∀ yticklabel interval boundaries

style

 ▷ zticklabel interval boundaries Axis style to display the interval bounds in the tick labels. style

▶ /pgfplots/colormap/hsv2

▷ /pgfplots/colormap/bright ▷ /pgfplots/colormap/pastel

style style

Styles provided by \usepgfplotslibrary{colormaps} which install the corresponding color map.

> /pgfplots/color of colormap = ⟨value⟩ (of ⟨color map⟩)? Set the color for drawing and filling from a color map. (value) is a number in the closed interval [0, 1000].  $\langle color map \rangle$  is either a color map name or a color map style.

▷ /pgfplots/const color of colormap = ⟨value⟩ ↓ option  $(of \langle color map \rangle)^{?}$ 

Like color of colormap but with piecewise constant interpolation.

```
\definecolor{\langle name \rangle} {\langle model \rangle} {\langle spec \rangle}
\langle model \rangle \rightarrow \texttt{rgb} \, | \, \texttt{cmy} \, | \, \texttt{cmyk} \, | \, \texttt{hsb} \, | \, \texttt{Hsb} \, | \, \texttt{gray} \, | \, \texttt{RGB} \, | \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray} \, | \, \texttt{Gray} \, | \, \texttt{HTML} \, \downarrow \, \texttt{HSB} \, | \, \texttt{Gray}

                      x = [0, 1], H = [0, 360], L = [0, 255] \cap \mathbb{Z}, M = [0, 240] \cap \mathbb{Z}, \text{ and } N = [0, 15] \cap \mathbb{Z}. All
```

colors are defined in the sRGB color space. HSB is a synonym for HSL.

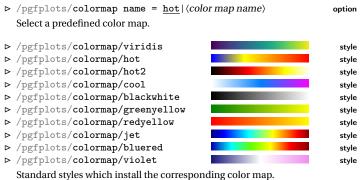

<pre>unired uniorange</pre>	unigreen unisea	<pre>uniblue univiolet</pre>	unigray1 unigray3
uniyellow	unicyan	unimagenta	unigray2
unilawn	unisky	unirose	unigray3

\definecolor{uniorange}{HTML}{DC7500} \definecolor{uniyellow}{HTML}{D8AB00} \definecolor{unilawn}{HTML}{7D9700} \definecolor{unigreen}{HTML}{007C00} \definecolor{unisea}{HTML}{00AC9B} \definecolor{unicyan}{HTML}{27D0FF} \definecolor{unisky}{HTML}{009EFF} \definecolor{uniblue}{HTML}{2754FF} \definecolor{univiolet}{HTML}{B565FF} \definecolor{unimagenta}{HTML}{FF83FF} \definecolor{unirose}{HTML}{FF3687} \definecolor{unigray1}{HTML}{6C6C6C} \definecolor{unigray2}{HTML}{B6B6B6} \definecolor{unigray3}{HTML}{919191}

\definecolor{unired}{HTML}{D82F00}

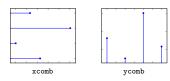

These colors are perceptually uniform, i.e., the primary colors red, green, and blue have similar lightness in the CIE L\*a\*b\* color space. Likewise for the secondary colors cyan, magenta and yellow. They also satisfy the RGB and CMY color models. The gray levels have the same lightness as the primary, secondary, and tertiary colors.

## 5.2 Color Maps

## 3.4 Comb Plots

option option

Render coordinates as horizontal or vertical lines respectively.

#### 3.5 Quiver Plots

```
▷ quiver = {⟨quiver options⟩}
```

option

Render coordinates as small arrows. The origin of the arrow is at the final point coordinates (x, y, z) and the direction and length of the arrow is defined by the direction coordinates (u, v, w).

The quiver/ prefix can be omitted within  $\langle quiver\ options \rangle$ .

```
\triangleright quiver/(u|v|w) = \underline{0}| \langle expression \rangle
```

option

The direction coordinates of the arrows. Within (expression), x, y, and z are bound to the final point coordinates.

For parametric plots use 'variable = t' and 'quiver/u = f(t)' and 'quiver/v = g(t)' to access the parameter.

```
\addplot[
 quiver = \{u = \{-\sin(t)\}, v = \{\cos(t)\}\},\
({\cos(t)}, {\sin(t)});
```

 $\triangleright$  quiver/(u|v|w) value = 0|\langle number \rangle

option

Like quiver/u, quiver/v, and quiver/w respectively but without parsing mathematical expressions. However, \thisrow{\column name\} and similar code works.

```
▶ quiver/colored
                                                                                      option

ightharpoonup quiver/colored = mapped color|\langle color \rangle
                                                                                      option
   Set a different color for each arrow. quiver/colored is an alias for
'quiver/colored = mapped color'. Please note that
\langle color \rangle, quiver = ...' is more efficient if \langle color \rangle is constant.
```

```
⊳ quiver/scale arrows = 1|⟨number⟩
```

option

Scale all arrows by a constant factor.

▷ quiver/update limits = true|false

Whether or not the coordinates of the arrow heads shall be considered when determining the axis limits.

```
⊳ quiver/every arrow

                                                                       style
```

```
Style to customize arrows individually at visualization time.
```

▷ quiver/before arrow

⊳ quiver/after arrow

Run (*T<sub>E</sub>X code*) before and after drawing a single arrow. Empty by default.

puiver/quiver legend

style

Style that redefines legend image code in order to produce a suitable legend for quiver plots.

## 4 Lines and Markers

## 4.1 Line Width

```
style
style
▷ /tikz/thin
                                    style
style
style
▷ /tikz/very thick
                                    style
style
 Predefined line widths.
```

 $\triangleright$  /tikz/line width =  $0.4pt | \langle dimension \rangle$ Set the line width.

option

## 4.2 Line Cap

▷ /tikz/line cap = butt|rect|round Set the line cap style.

rect

#### 4.3 Line Join

butt

▷ /tikz/line join = miter|bevel|round Set the line join style.

option

▷ /tikz/miter limit = 10|⟨number⟩

option

When the ratio of the miter length to the line width is greater than \( number \), the miter join is replaced by a bevel. A miter limit  $\ell = 1/\sin(\alpha/2)$  for  $\alpha \in (0^{\circ}, 180^{\circ})$  will create a bevel join for angles less than  $\alpha = 2 \cdot \arcsin(1/\ell)$ .

#### 4.4 Dash Pattern

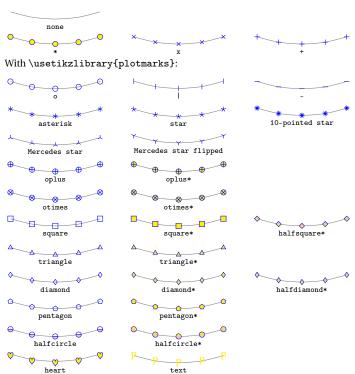

⊳ /tikz/solid	 style
> /tikz/dashed	 style
> /tikz/dotted	 style
> /tikz/dashdotted	 style
<pre>     / tikz/dashdotdotted </pre>	 style
> /tikz/densely dashed	 style
> /tikz/densely dashed > /tikz/densely dotted	•
> /tikz/densely dotted > /tikz/densely dashdotted	style
•	 style
> /tikz/densely dashdotdotted	 style
> /tikz/loosely dashed	 style
	 style
> /tikz/loosely dashdotted	 style
	 style
Predefined line styles.	

▷ /tikz/dash pattern = ((on|off) ⟨dimension⟩)<sup>+</sup> option Set the dash pattern (line style) for drawing lines, e.g., 'dash pattern = on 3.5mm off 0.7mm'.

▷ /tikz/dash phase = Opt|⟨dimension⟩ option Start the dash pattern at offset (dimension).

#### 4.5 Markers

Standard markers:

```
All markers plotted with
'mark options = {draw = blue, fill = yellow}' and
'mark color = pink'. You can rotate makers with, e.g.,
'mark options = {rotate = 90}'.
```

▷ /tikz/mark = \*|⟨marker⟩ option Use (marker).

▷ /tikz/mark size = 2pt|⟨dimension⟩ option Marker size,  $\langle dimension \rangle$  is either the radius or about half the width or height.

▷ /tikz/mark repeat = 1|⟨integer⟩ option Draw a marker at every  $\langle integer \rangle^{th}$  sample.

▷ /tikz/mark phase = 1|⟨integer⟩ option Draw the first marker at the  $\langle integer \rangle^{th}$  sample;  $\langle integer \rangle$  is one based.

▷ /tikz/mark indices = {}|{⟨comma-separated list of integers⟩} option Explicit sample indices for drawing markers. ⟨comma-separated list of integers⟩ can contain . . . expressions, for example

'mark indices =  $\{1, 2, ..., 7\}$ '. style

▷ /tikz/mark options = {⟨options⟩} option

Redefine 'every mark' so that it sets (options). ▶ /pgfplots/no markers style

▷ /pgf/mark color = white | ⟨color⟩ option Additional fill color for halfcircle, halfcircle\*, halfdiamond\*, and halfsquare\* markers.

Disable markers; even for cycle lists that contain markers.

▷ /pgf/text mark = p|⟨text⟩ option Define the text for 'mark = text'.

▷ /pgf/text mark as node = false|true Whether or not to draw text markers as nodes.

▷ /pgf/text mark style = {⟨options⟩}

This style is applied before drawing a marker.

option

option

Customize the appearance of text markers. When 'text mark as node' is

true, 'text mark style' are \node options. Otherwise, 'text mark style' are \pgftext options.

#### 5 Color Data

## 5.1 Colors

Color support is provided by the xcolor package. Standard color names:

▷ /tikz/color = ⟨color⟩

option

Set the color for drawing and filling. You can omit the option key if  $\langle color \rangle$  is a color name.

▷ /tikz/draw = ⟨color⟩ option ▷ /tikz/fill = ⟨color⟩ option

Set the color for drawing or filling respectively. You can use none as \( color \) to disable drawing or filling.
